WITNESS OFFICIAL MEASURER

INSTRUCTIONS FOR MEASURING MOUNTAIN GOATS

All measurements must be made with a ¼-inch wide flexible steel tape to the nearest one-eighth of an inch. Whenever it is necessary to change direction of measurement, mark a control point and swing tape at this point. Enter fractional figures in eighths, without reduction. Official measurements cannot be taken until the horns have air dried for at least 60 days after the animal was killed.

A. Greatest Spread is measured between perpendiculars at a right angle to the centerline of the skull. **Greatest spread does not add into the final score.**

B. Tip to Tip Spread is measured between the tips of the horns. **Tip to tip spread does not add into the final score.**

C. Length of Horn is measured from the lowest point in front over outer curve to a point in line with the tip.

D-1. Circumference of Base is measured at a right angle to the axis of the horn. Do not follow irregular edge of the horn; the line of measurement must be entirely on horn material.

D-2-3-4. Circumferences of Quarters. Divide Measurement C of longer horn by four. Starting at the base, mark both horns at these quarters (even though the other horn is shorter) and measure circumferences at these marks, with measurements taken at right angles to the horn axis.
